Intro to up

- Excited about all-things-up
- Other people's ideas are nothing more than "Point A to Point B".
  - Our infrastructure ***IS*** "Point B"
- If we can do this; I am confident, we can **Tackle Climate Change**
  - Pods / *your* piece of the "flying cars"
  - Gliders / other mobility units ("Chassis")
  - Buses – Small & Large
  - Space Elevator / Shipyard
    - AND -
  - Ice Halo! Let's actually get all of this started, using this one right there!

Flying Cars – 1) Pods

- My Own Space - No "Wet Spot"
- A place to confidently leave my stuff..
- Affordable - (like daily transportation)
- With an option of special occasions (like renting a race car)

- Sizing Standards [A, B, C, etc.] (like batteries)
  - Small like a Smart car / medium like "efficiency" apt / large like home-sized
- Safety vs. Mobility Spectrum ..
  - Doing 2mph on the ground? -- bamboo is fine
  - Doing 200mph in the air? -- safety-engineered version
- Ratings [Land, Sea, Air]

Gliders

- Gliders are mobility units, minus the engines
  - I can't wait for something better than a roller coaster, in my own personal pod
  - I am so excited to get queued for take-off at 7:45 for an 8:00 pm sunset, and an hour's glide ride
- Powering / launching:
  - Some gas engine? Some slingshot? Some railgun? Some high pressure in an air tunnel*?
  - That last being the most exciting – if we can produce that along a ridgeline of a mountain?? We could potentially find a new means of launching...
  - Maybe there are some engineers out there, who are also excited to explore this new means of both fun & mobility
- Achieve maximum speed & height, then autonomous glide
- Either return to that same location, or go to the next location, for more adventures, tomorrow
- Always a new sunrise

Flying Cars 2) 'Chassis' / Mobility - Design

- imagine a Box truck, but your Pod would be the "box"
- We are going to apply the "box-truck" concept to flying cars
  - Hopefully – also to water, land, etc.
- Similar also to trains, with 6-8 small Pods / 2-3 "efficiencies" on each
- "Modular" / "Lego"-esque "Shoebox" | "cubby" design
  - designed *around* the sizes of Pods [A, B, C, etc.]
- Three rules; 1) Redundancy 2) Redundancy 3) Redundancy
- No ownership / internationally operated
  - More on that in the "Buses" section
- All 'Chauffeured' (as opposed to individually controlled)

Flying Cars - Buses – Design

- Infrastructure, with multiple sizes & types of "cubbies", for different sized Pods
- From single-use yachts to a cruise ships for thousands
  - Personal like a yacht – still not "owned"
  - Airplane – a dozen or two folks, all headed in the same direction
  - Huge -- Local – like apartment complexes / parks for one place
  - Huge -- Express – hybrid of cruise ships and cargo ships

Flying Cars – Buses – Hulls & Balloons

- Same three rules about Redundancy
  - If the titanic had been designed with *redundancy* as the *Core* principle; even when 3/8ths got smashed by an iceberg, 5/8ths should have been fully functioning "segments"
  - Extend that kind of thinking
- Segments are loaded with hydrogen "balloons" which can be inflated / deflated to change elevation
- Segments are then flooded with Nitrogen, between the balloons
- Even if a balloon leaks; the contents of the segments get cycled regularly – leak can be identified, corrected, never cause a problem.. even if an entire segment needs to be replaced

Flying Cars - 3) Buses – Worries [Operation]

- No ownership of these things..
  - We saw the reactions to spy balloons.
    - Those were helium
    - And small
    - We can't get shot down
  - A million reasons – we need to prevent misuse
    - no disgruntled former employees
    - no Spying
    - No jihad
    - There's a million examples...

"ice halo" - tackle global warming

- One the number one crises facing humanity right now is Global Warming. We *must* "turn down the thermostat"
- A major symptom has been the disappearance of the Arctic ice caps
- To supplement their important reflective ability, I'd like to experiment w propulsion in upper atmosphere
  - Blast ribbons of steam – very wide contrails, lasting potentially hours
- We can actually get started w this relatively quickly. Although we are designing this around propulsion for the Buses, it's important to note that we can sell bus rides *and* save the planet
  - Your "Vacation" is humanity's "Salvation" :)

Space Elevator

- I don't *just* dream of flying cars, I want to accelerate the process of moving humanity forward on its quest to explore outer space
- This is a very long term consideration :)
- I don't see *rockets* as the *right* way of getting into space
- I want to explore launching from a platform that is *already* as close as possible to the upper reaches of the stratosphere
- Create 1,000 or so "platforms" / "stages", each engineered uniquely for each level of the atmosphere
- Their 1 design spec; stay put, regardless of temperature and wind changes

Shipyard on top of the stratosphere

- The largest & top-most of the sections of the Space Elevator
- Float a massive "boat" - which is also a ship yard - as close to the top of the stratosphere as possible.. (50 km is top – 30-40 km?)
- Strato-Boats
  - Construct rigid bodies from extremely lightweight materials
  - Empty their hulls.. When they fall back on top of the stratosphere – no matter how thin at the top – they should float
  - "Void-based displacement" should 100% be feasible! - **I can't wait** to have a boat that floats because of [NULL]
- "Dear Billionaire class: *These* are the yachts you want!"

Flying Cars – Closing

- These ideas seem feasible to pursue, *right now*
- I don't want to be beholden to profits and the demands of the insatiable few
- We need a "resource"-raiser
  - Not a "fund" raiser, because I don't want to think in terms of "dollars"
  - **Terran Astra Parks** – definitely where you want to go, for your next outing!
